

## **The Structure of the atom**

### **Dalton's Atomic Theory**

**Elements are composed of extremely small particles called atoms. All atoms of same element are alike.**

**The separation of atoms and union of atoms occur in chemical reactions.**

**In these reactions, no atom is created or destroyed, and no one atom of one element is converted into an atom of another element.**

**A chemical compound is the result of the combination of atoms of two or more elements in a simple numerical ratio.**

## The structure of the atom

Atoms are made up of the following particles:

|                                      | mass                         |
|--------------------------------------|------------------------------|
| <b>Electrons:</b> negatively charged | $9.1095 \times 10^{-31}$ kg  |
| <b>Protons:</b> positively charged   | $1.67252 \times 10^{-27}$ kg |
| <b>Neutrons:</b> neutral             | $1.67495 \times 10^{-27}$ kg |

## **The atom**

**neutrons and protons form what we call the nucleus**

**the mass of the nucleus constitute most of the mass of the atom**

**the atom is neutral in charge**

**elements are represented by symbols and numbers**

$\frac{A}{Z} \text{ Symbol}$

**A**

**the mass number = number of protons + number of neutrons**

**Z**

**the atomic number = number of protons = number of electrons**

**the number of neutrons can be calculated as**

$$\mathbf{N = A - Z}$$

**Nuclides that have identical  $Z$  and different  $A$  (i.e. differ in number of neutrons) are: *isotopes***

**All three are *isotopes* of hydrogen**

# The periodic table

|        |             | MAIN-GROUP ELEMENTS       |                          |                          |                            |                            |                            |                            |                            |                            |                          | MAIN-GROUP ELEMENTS       |                           |                           |                           |                          |                          |                          |                          |

Metals

Non-metals

**A molecule is formed from two or more atoms**

**Ions bear negative or positive charges**

***Example***

**Determine the number of electrons, protons, and neutrons for**

|                       | Electrons | Neutrons | protons |
|-----------------------|-----------|----------|---------|
| ${}_{19}^{39}K^+$     | 18        | 20       | 19      |
| ${}_{35}^{80}Br^-$    | 36        | 45       | 35      |
| ${}_{18}^{40}Ar$      | 18        | 22       | 18      |
| ${}_{13}^{27}Al^{3+}$ | 10        | 14       | 13      |

## **Atomic mass**

**The mass of an atom is related to the number of electrons , protons , and neutrons it has.**

**One cannot weigh a single atom, but it is possible to determine the mass of one atom relative to another experimentally.**

**By international agreement, an atom of the carbon isotope  $^{12}\text{C}$  has a mass of exactly *12 atomic mass units (amu)***

## Average Atomic mass

**Most naturally occurring elements have more than one isotope. This means that the reported mass in the tables is the average mass of the naturally occurring mixture of isotopes.**

**Example:**

**The natural abundances of  $^{12}\text{C}$  and  $^{13}\text{C}$  are 98.89% and 1.11% respectively**

**The average atomic mass of carbon =**

$$\begin{aligned} & (0.9889)(12.0000\text{amu}) + (0.0110)(13.0335\text{amu}) \\ & \qquad \qquad \qquad = 12.01\text{amu} \end{aligned}$$

## Molar mass and Avogadro's number

### The mole

The amount of substance that contain as many elementary entities (atoms, molecules.....)

as there are atoms in exactly 12 grams of the  $^{12}\text{C}$  isotope.

This number is determined experimentally,  
the current accepted value is

**1 mole =  $6.022045 \times 10^{23}$  particles**

This number is called **Avogadro's number**

**we have seen that**

**1 mole of  $^{12}\text{C}$  has a mass of exactly 12 g**

**and contains  $6.022 \times 10^{23}$  atoms**

**this mass of  $^{12}\text{C}$  is its *molar mass***

**Molar Mass**

**the mass of one mole of units**

**Numerically:**

**molar mass of  $^{12}\text{C}$  in grams = atomic mass of  $^{12}\text{C}$  in amu**

**the atomic mass of Na = 22.99 amu**

**the molar mass of Na = 22.99 g**

**Example:**

**How many grams of Mn are there in 0.356 mol of Mn**

**Molar mass of Mn = 54.94 g**

**1 mol Mn  $\equiv$  54.94 g Mn**

**0.356 mol Mn  $\equiv$  x g Mn**

$$x = \frac{0.356 \text{ mol} \times 54.94 \text{ g}}{1 \text{ mol}} = 19.6 \text{ g}$$

**Example:**

**How many atoms of Zn are there in 0.356 mol of Zn?**

**Molar mass of Zn = 65.39 g**

**1 mol Zn  $\equiv$   $6.022 \times 10^{23}$  atoms**

**0.356 mol Zn  $\equiv$  x atoms**

$$x = \frac{0.356 \text{ mol} \times 6.022 \times 10^{23} \text{ atoms}}{1 \text{ mol}} = 2.14 \times 10^{23} \text{ atoms}$$

**Example:**

**Calculate the mass of one S atom.**

**Molar mass of S = 32.07 g**

**32.07 g  $\equiv$  6.022  $\times$  10<sup>23</sup> atoms**

**x g  $\equiv$  1 atom**

$$x = \frac{1 \text{ atoms} \times 32.07 \text{ g}}{6.022 \times 10^{23} \text{ atoms}} = 5.325 \times 10^{-23} \text{ g}$$

## Naming Compounds

Ionic compounds consist of positive ions (cations) and

Negative ions (anions)

Cations names are similar to that of the element

| Cation           | Name                 |
|------------------|----------------------|
| $\text{Na}^+$    | Sodium ion           |
| $\text{K}^+$     | Potassium ion        |
| $\text{NH}_4^+$  | Ammonium ion         |
| $\text{Mg}^{2+}$ | Magnesium ion        |
| $\text{Fe}^{2+}$ | Iron (II) or ferrous |
| $\text{Fe}^{3+}$ | Iron (III) or ferric |

## Anions named by adding “ide” to the element’s name

$Cl^-$  Chloride

$OH^-$  Hydroxide

$I^-$  Iodide

$NO_3^-$  Nitrate

$CO_3^{2-}$  Carbonate

$O^{2-}$  Oxide

$CN^-$  Cyanide

$SO_4^{2-}$  Sulfate

$PO_4^{3-}$  Phosphate

**Ionic compounds names start with the positive ion followed by the negative ion**

**NaCl          Sodium Chloride**

**KI              Potassium Iodide**

**$Na_2CO_3$           Sodium Carbonate**

**$KCN$               Potassium Cyanide**

$Mg(NO_3)_2$  Magnesium Nitrate

$CaSO_4$  Calcium Sulfate

$(NH_4)_3PO_4$  Ammonium Phosphate

## Non-ionic compounds

Hydrogen chloride

Hydrogen bromide

Carbon monoxide

Carbon dioxide

## **Chemical Formulas**

### **Simple formula(empirical formula)**

**The formula that is written using the simplest whole-number ratio**

### **Molecular formula**

**Shows the exact number of atoms of each element in the smallest unit of a substance**

## **Water**

**Simple formula:**  $\text{H}_2\text{O}$

**Molecular formula:**  $\text{H}_2\text{O}$

## **Hydrogen peroxide**

**Simple formula:**  $\text{HO}$

**Molecular formula:**  $\text{H}_2\text{O}_2$

## **Molecular weight of molecules (molar mass)**

**The sum of the atomic molar masses of atoms in the molecule.**

**Example**

**What is the molecular weight of CH<sub>4</sub>?**

**Molecular weight of CH<sub>4</sub> = 12.01+4(1.008) = 16.04 g**

**This means that one mole of CH<sub>4</sub> weighs 16.04 g**

**Example:**

**How many moles are there in 6.07g of CH<sub>4</sub>?**

$$1 \text{ mol CH}_4 \equiv 16.04 \text{ g}$$

$$x \text{ mol CH}_4 \equiv 6.07\text{g}$$

$$x = \frac{6.07 \text{ g} \times 1 \text{ mol}}{16.04 \text{ g}} = 0.378 \text{ mol}$$

## Example

Determine the molecular formula of a compound that has a simple formula of  $P_2O_5$  and a molecular weight of 284g/mol.

Molar mass of the simple formula =  $(31 \times 2) + (16 \times 5) = 142g$

$$\text{The ratio between the two formulas} = \frac{284 \text{ g}}{142 \text{ g}} = 2$$

The molecular formula of the compound =

## Percent composition of a compound

The percent composition by mass is the percent by mass of each element the compound contains.

### *Example*

The percent composition of  $\text{H}_2\text{O}$  is calculated as follows:

$$\% \text{H} = \frac{2 \times 1.008 \text{ g}}{18.016} \times 100 = 11.19\%$$

$$\% \text{O} = \frac{16.0 \text{ g}}{18.016} \times 100 = 88.8\%$$

**Problem:**

**Calculate the percent composition of  $\text{H}_2\text{O}_2$ .**

**Example:**

**Vitamin C is composed of 40.92% carbon (C), 4.58% hydrogen (H), and 54.5% oxygen (O). determine the empirical formula of vitamin C.**

**Because the sum of the percentages is 100 it is appropriate to consider 100 grams of vitamin C**

**In a 100g of Vitamin C there will be:**

**40.92gC**

**4.58g H**

**54.50gO**

**using the molar mass of the elements we can find out number of moles:**

$$n_C = \frac{40.92g}{12.01g / mol} = 3.407mol$$

$$n_{\text{H}} = \frac{4.58 \text{ g}}{1.008 \text{ g / mol}} = 4.54 \text{ mol}$$

$$n_{\text{O}} = \frac{54.50 \text{ g}}{16.00 \text{ g / mol}} = 3.406 \text{ mol}$$

**the formula that gives the ratios of the atoms in vitamin C is**

**To arrive to the simple formula we have to convert these numbers to whole numbers by dividing all subscripts by the smallest one**

$$\text{C: } \frac{3.407}{3.406} = 1$$

$$\text{H: } \frac{4.54}{3.406} = 1.33$$

$$\text{O: } \frac{3.406}{3.406} = 1$$

**Now the formula is :  $\text{C}_1\text{H}_{1.33}\text{O}_1$**

**We still need to convert 1.33 to an integer**

**This can be done by trial and error:**

$$1 \times 1.33 = 1.33$$

$$2 \times 1.33 = 2.66$$

$$3 \times 1.33 = 3.99 \approx 4$$

**so we have to multiply all subscripts by 3 to get the smallest whole numbers in the formula**

**The simple formula of vitamin C is  $\text{C}_3\text{H}_4\text{O}_3$**
