Read the following text then choose the correct answer a, b, c or d: {60 m}

The human body is a wonderful machine which performs several functions without rest from birth. Our body continues to work, without stopping for a second. The main organs of the human body are lungs, heart, kidney, liver and brain. These organs work together and are controlled by the brain. Each system such as digestive system, excretory system, circulatory system, endocrine system, nervous system or muscular system carries out a major function. All of them are controlled by the brain which gives us intelligence to use our physical and mental abilities. The body has more than 50,000 living cells of two hundred different types. These cells include neurons (nerve cells) and glands (specialized cells). The hormones and enzymes are produced and secreted by these glands that perform different functions. The human body is covered by the skin, which is a flexible covering that protects the body and keeps water and harmful germs out. The body's strong internal framework (skeleton) is made of 206 bones, connected at the joint, such as in legs. These joints help us to move. The skull bone supports the head and limbs and protects the spinal cord. Between the skeleton and the skin, there are about 500 muscles. Nerves spread from the brain to all parts of the body, carrying signals in the form of tiny electrical impulses. The sense organs namely eyes, nose, ears, tongue and skin pass the messages to the brain through nerves. They take the instructions from the brain to the muscles. The brain automatically controls breathing, heartbeat, digestion, etc.

Choose the right answer a, b, c or d

1 The is the soldier of our body.

a immune system

b blood

c cells

d bones

2 the human body is considered a great machine because it performs

a. one function

b two functions

c. no function

d. a lot of functions

3 All the body organs are controlled by

a. the liver

b the heart

c. the skin

d. the brain

Choose the right answer a, b, c or d

4. the underlined word excretory means:

a. an acute inflammation of the lungs

a. relating to the system in your body that produces hormones

b. produced

c. an arm or leg

d. having the function of getting rid of waste material from the body.

6. the underlined word secreted means:

a. relating to the system in your body that produces hormones

b. produced

c. an arm or leg

d. having the function of getting rid of waste material from the body.

Read the following text then choose the correct answer a, b, c or d: (60 m)

The immune system has a vital role since it protects your body from harmful substances, germs and cell changes that could make you ill. It is made up of various organs, cells and proteins. As long as your immune system is running smoothly, you don't notice that it's there. But if it stops working properly - because it's weak or can't fight particularly aggressive germs - you get ill. Germs that your body has never encountered before are also likely to make you ill. Some germs will only make you ill the first time you come into contact with them. These include childhood diseases like chickenpox.

The task of the immune system

Without an immune system, we would have no way to fight harmful things that enter our body from the outside or harmful changes that occur inside our body. The main tasks of the body's immune system are:

- to fight disease-causing germs (pathogens) like bacteria, viruses, parasites or fungi and to remove them from the body.
- to recognize and neutralize harmful substances from the environment
- to fight disease-causing changes in the body, such as cancer cells.

Choose the right answer a, b, c or d

7. The immune system has an important role since it protects from.....

- a. cell changes b germs c. both a, b d. only heart
