Read the following questions carefully. Then answer them by shading the correct answer on the answer sheet.

Part One: Read the following passage, and then answer the questions below.

Teeth are the hardest parts of the human body. They often survive long after the bones, or skeleton, have decayed. Scientists have discovered ancient teeth from animals and humans. These remains help scientists learn about the past. For example, they can tell whether a dinosaur ate other animals or plants from the kind of teeth it had. Teeth are hard because they are made mainly of dentin and covered in a thin layer of enamel. Dentin is like bone only harder. Enamel is the hardest material in the body. Within this hard structure is a soft pulp full of blood vessels and nerves. If you have a toothache, it's probably because something is irritating a nerve in the pulp. Yet hard as they are, teeth can decay. Have you ever had a cavity? A cavity is a hole in a tooth. It develops when tiny bacteria eat away at the enamel and dentin. Luckily, a dentist can fill the holes that bacteria make. Once a tooth decays, it can more easily crack and break. That's why it's so important to keep teeth clean. Brushing your teeth helps get rid of bacteria and the bits of food that bacteria feed on. Teeth do lots of things. They help you eat by tearing, grinding, and chewing food. It's step one in the process of digestion. Teeth also help you talk. Teeth help determine how you look. They support muscles in your face. If you didn't have teeth, your lips would collapse inward.
