Relating Absolute Value and Distance

DEFINITION 1 Absolute Value

$$|x| = \begin{cases} -x & \text{if } x < 0 \\ x & \text{if } x \geq 0 \end{cases} \quad \begin{array}{l} |-3| = -(-3) = 3 \\ |4| = 4 \end{array}$$

[Note: $-x$ is positive if x is negative.]

Example: Write without the absolute value:

(A) $|\pi - 3| = \pi - 3$

(B) $|3 - \pi| = -(3 - \pi) = \pi - 3$

Remark: $|b - a| = |a - b|$

Note:

$\pi = 3.14$ So
 $3.14 - 3 = 0.14$
positive

DEFINITION 2 Distance Between Points A and B

Let A and B be two points on a real number line with coordinates a and b , respectively. The **distance between A and B** is given by

$$d(A, B) = |b - a|$$

This distance is also called the **length of the line segment** joining A and B .

Example: Find the distance between given points

(A) $a = 4, b = 9$ (B) $a = 9, b = 4$ (C) $a = 0, b = 6$

Solution:

Remark:

$$d(A, B) = d(B, A)$$

$$d(A, B) = |6 - 0| = |6| = 6$$

Remark:

$$d(O, B) = |b - 0| = |b|$$

↓
نقطة الأصل

Example: Express each verbal statement as an absolute value equation or inequality.

(A) x is 4 units from 2.

(B) y is less than 3 units from -5 .

(C) t is no more than 5 units from 7.

(D) w is no less than 2 units from -1 .

SOLUTIONS

(A) $d(x, 2) = |x - 2| = 4$

(B) $d(y, -5) = |y + 5| < 3$

(C) $d(t, 7) = |t - 7| \leq 5$

(D) $d(w, -1) = |w + 1| \geq 2$

Solving Absolute Value Equations and Inequalities

Steps for Solving Absolute Value Equation:

- Isolate the absolute value
- Analyze the equation "Is it possible to solve?"
- Solve the equation
- Check your answer

ملاحظة: إذا كانت المعادلة تساوي عدد سالب فالمعادلة مستحيلة الحل

Example: Solve the following Equations

1) $|x-3|=5$

Step 1: ✓

Step 2: ✓

Step 3:

$$\begin{aligned} x-3 &= 5 & \text{or} & & -(x-3) &= 5 \\ x &= 5+3 & \text{or} & & -x+3 &= 5 \\ x &= 8 & \text{or} & & -x &= 5-3 \\ & & & & -x &= 2 \\ & & & & x &= -2 \end{aligned}$$

بتطبيق تعريف الدالة المطلقة

Step 4:

$$\begin{array}{l} x=8 \\ |8-3|=5 \\ |5|=5 \\ 5=5 \end{array} \quad \Bigg| \quad x = -2$$

$\therefore x = \{-2, 8\}$

التمثيل البياني:

يسمى هذا النوع من الأقواس رمز المجموعة
Set notation

$$2) |3x - 7| + 7 = 2$$

$$\text{Step 1: } |3x - 7| = 2 - 7$$

$$|3x - 7| = -5$$

Step 2: No Solution or \emptyset

H.W: Solve

$$|x+1| = 0$$

$$3) |3x - 7| + 7 = 9$$

$$\text{Step 1: } |3x - 7| = 9 - 7$$

$$|3x - 7| = 2$$

Step 2:

$$\text{Step 3: } 3x - 7 = 2 \text{ or } -(3x - 7) = 2$$

$$3x = 2 + 7 \text{ or } -3x + 7 = 2$$

$$3x = 9 \text{ or } -3x = 2 - 7$$

$$x = 3 \text{ or } -3x = -5$$

$$x = 5/3$$

Step 4:

$$x = 3$$

$$|3 \cdot 3 - 7| = 2$$

$$|9 - 7| = 2$$

$$|2| = 2$$

$$2 = 2$$

$$x = 5/3$$

$$|\cancel{3} \cdot \frac{5}{\cancel{3}} - 7| = 2$$

$$|5 - 7| = 2$$

$$|-2| = 2$$

$$2 = 2$$

$$\therefore x = \{3, 5/3\}$$

Steps for Solving Absolute Value Inequalities:

- Isolate the absolute value
- Analyze the Inequality "Is it possible to solve?"
- Solve the absolute value inequality
- Check your answer

ملاحظة: اذا كانت المتراجحة اقل من الصفر تكون مستحيلة الحل

Example: Solve the following Inequalities

1) $|x-3| < 5$

Step 1: ✓

Step 2: ✓

Step 3: $x-3 < 5$ and $-(x-3) < 5$

$x < 5+3$ and $-x+3 < 5$

$x < 8$ and $-x < 5-3$

$-x < 2$

$x > -2$

ملاحظة: عند ضرب المتراجحة بعدد سالب نعكس إشارة المتراجحة

Step 4:

$x < 8$

$|7-3| < 5$

$|4| < 5$

$4 < 5$ works!

$x > -2$

$|-1-3| > -2$

$|-4| > -2$

$4 > -2$ works!

$\therefore x = (-2, 8)$

يسمى هذا النوع من الأقواس رمز الفترة

Interval notation

جميع الأعداد ما بين ٨ و -٢ تحقق المتراجحة

$$2) 0 < |x-3| < 5$$

$$0 < |x-3|$$

or

$$|x-3| > 0$$

If $x=3$ then

$$|3-3| > 0$$

$$|0| > 0$$

$0 > 0$ does not work

$$\text{So } x = (-2, 3) \cup (3, 8)$$

$$|x-3| < 5$$

تم حلها في المثال السابق
وكانت النتيجة كالتالي

$$x = (-2, 8)$$

H.W: Solve

1) $0 < |x+2| < 6$

2) $|x+2| \geq 0$

$$3) |x-3| > 5$$

Step 1: ✓

Step 2: ✓

Step 3: $x-3 > 5$ or $-(x-3) < 5$

$$x > 5+3 \quad \text{or} \quad -x+3 < 5$$

$$x > 8 \quad \text{or} \quad -x < 5-3$$

$$-x < 2$$

$$x < 2$$

Step 4:

$$\therefore x = (-\infty, -2) \cup (8, \infty)$$

Form ($d > 0$) Geometric interpretation

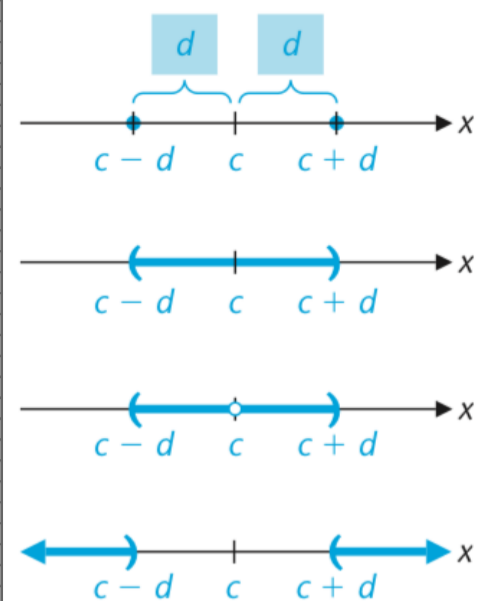

Solution

Graph

- $|x - c| = d$ Distance between x and c is equal to d .
- $|x - c| < d$ Distance between x and c is less than d .
- $0 < |x - c| < d$ Distance between x and c is less than d , but $x \neq c$.
- $|x - c| > d$ Distance between x and c is greater than d .

$\{c - d, c + d\} \rightarrow$ Set notation

- $(c - d, c + d)$ Interval notation.
- $(c - d, c) \cup (c, c + d)$
- $(-\infty, c - d) \cup (c + d, \infty)$

THEOREM 2 Properties of Equations and Inequalities Involving $|x|$

For $p > 0$:

1. $|x| = p$ is equivalent to $x = p$ or $x = -p$.
2. $|x| < p$ is equivalent to $-p < x < p$.
3. $|x| > p$ is equivalent to $x < -p$ or $x > p$.

THEOREM 3 Properties of Equations and Inequalities Involving $|ax + b|$

For $p > 0$:

1. $|ax + b| = p$ is equivalent to $ax + b = p$ or $ax + b = -p$.
2. $|ax + b| < p$ is equivalent to $-p < ax + b < p$.
3. $|ax + b| > p$ is equivalent to $ax + b < -p$ or $ax + b > p$.

Continuous: Solving Absolute Value Problems

Example: Solve each equation or inequality

A) $|3x + 5| = 4$

B) $|x| < 5$

C) $|2x - 1| < 3$

D) $|7 - 3x| \leq 2$

Solution: Step 1 and Step 2 are done.

Step 3:

By applying definition \leftarrow **(A) $|3x + 5| = 4$** \rightarrow By applying theorem 3

$$3x + 5 = 4 \text{ or } -(3x + 5) = 4$$

$$3x = 4 - 5 \text{ or } -3x - 5 = 4$$

$$3x = -1 \text{ or } -3x = 9$$

$$x = -\frac{1}{3} \text{ or } x = -3$$

$$3x + 5 = 4 \text{ or } 3x + 5 = -4$$

$$3x = 4 - 5 \text{ or } 3x = -9$$

$$\text{or } x = -3$$

Step 4: check!!

$$\therefore x = \left\{ -\frac{1}{3}, -3 \right\}$$

(B) $|x| < 5$

$$x < 5 \text{ and } -x < 5$$

$$x > -5$$

$$-5 < x < 5$$

$$\therefore x = (-5, 5)$$

Step 4: check!

$$\therefore x = (-5, 5)$$

$$(C) |2x - 1| < 3$$

$$2x - 1 < 3 \text{ and } -(2x - 1) < 3$$

$$2x < 4 \text{ and } -2x + 1 < 3$$

$$x < 2 \text{ and } -2x < 2$$

$$-x < 1$$

$$x > -1$$

$$-3 < 2x - 1 < 3$$

$$-3 + 1 < 2x < 3 + 1$$

$$-2 < 2x < 4$$

$$-1 < x < 2$$

step 4: ✓

$$\therefore x = (-1, 2)$$

H.W

$$(D) |7 - 3x| \leq 2$$

$$-2 \leq 7 - 3x \leq 2$$

$$-9 \leq -3x \leq -5$$

$$3 \geq x \geq \frac{5}{3}$$

$$\frac{5}{3} \leq x \leq 3$$

$$\therefore x = \left[\frac{5}{3}, 3 \right]$$

ماذا لاحظتني في
B,C,D

Example: Solve the following :

$$(A) |x| > 3$$

$$x > 3 \quad \text{or} \quad x < -3$$

$$(-\infty, -3) \cup (3, \infty)$$

$$(B) |2x - 1| \geq 3$$

$$2x - 1 \geq 3 \quad \text{or} \quad 2x - 1 \leq -3$$

$$2x \geq 3 + 1 \quad \text{or} \quad 2x \leq -3 + 1$$

$$2x \geq 4 \quad \text{or} \quad 2x \leq -2$$

$$x \geq 2 \quad \text{or} \quad x \leq -1$$

$$\therefore x = (-\infty, -1] \cup [2, \infty)$$

$$(C) |7 - 3x| > 2$$

$$7 - 3x > 2 \quad \text{or} \quad 7 - 3x < -2$$

$$-3x > 2 - 7 \quad \text{or} \quad -3x < -2 - 7$$

$$-3x > -5 \quad \text{or} \quad -3x < -9$$

$$x < \frac{5}{3} \quad \text{or} \quad x > 3$$

$$\therefore x = (-\infty, \frac{5}{3}) \cup (3, \infty)$$

ماذا لاحظتني؟

Example: Solve $|x+4| = 3x - 8$

$$x+4 = 3x-8 \quad \text{or} \quad -(x+4) = 3x-8$$

$$4+8 = 3x-x \quad \text{or} \quad -x-4 = 3x-8$$

$$12 = 2x \quad \text{or} \quad -4+8 = 3x+x$$

$$6 = x \quad \text{or} \quad 4 = 4x$$

$$1 = x$$

check:

$$x = 6$$

$$|6+4| = 3(6) - 8$$

$$|10| = 18 - 8$$

$$10 = 10 \quad \checkmark$$

$$x = 1$$

$$|1+4| = 3(1) - 8$$

$$|5| = -5$$

$$5 \neq -5$$

$$\therefore x = \{6\}$$

ملاحظه : في هذه المسألة لا يمكن تطبيق نظرية خصائص القيمة المطلقة وذلك لوجود x في الطرف الاخر وهذا يعني لا نعلم ما اذا كانت قيمة x موجبة او سالبة.

H.W: Solve
 $|3x-4| = x+5$

Absolute Value and Radical Inequalities

Definition: For any real number

$$\sqrt{x^2} = \begin{cases} -x & \text{if } x < 0 \\ x & \text{if } x \geq 0 \end{cases}$$

For example :

$$\sqrt{(2)^2} = \sqrt{(-2)^2} = \sqrt{4} = 2$$

Remark: $\sqrt{x^2} = |x|$

Example: Solve $\sqrt{(x-2)^2} \leq 5$

Solution: $|x-2| \leq 5$

$$-5 \leq x-2 \leq 5$$

$$-5+2 \leq x \leq 5+2$$

$$-3 \leq x \leq 7$$

$$\therefore x = [-3, 7]$$

H.W: Solve
 $\sqrt{(x+2)^2} < 3$
