## Average Atomic Mass

Gallium has two naturally occurring isotopes. The mass of gallium-69 is 68.9256 amu and it is 60.108 \% abundant. The mass of gallium-71 is 70.9247 amu and it is $39.892 \%$ abundant. Find the atomic mass (average atomic mass) of gallium.
Average Atomic Mass $=\left(\frac{\% \text { abundance of isotope } 1}{100}\right)($ mass of isotope 1$)+\left(\frac{\% \text { abundance of isotope } 2}{100}\right)($ mass of isotope 2$)+\ldots$

## Average atomic mass of Gallium (Ga):

$$
\frac{(60.108 \times 68.9256)+(39.892 \times 70.9247)}{100}=69.69 \mathrm{amu}
$$

Antimony has two naturally occurring isotopes. The mass of antimony-121 is 120.904 amu and the mass of antimony-123 is 122.904 amu . Calculate the natural abundance of these two isotopes.
The average atomic mass of antimony ( $\mathrm{Sb}=121.76 \mathrm{amu}$ ).

Average atomic mass $=\Sigma$ (The natural abundance $x$ Atomic Mass) for each isotope
Remember that the sum of the two abundances must be 100.
Assume that : the natural abundance of ${ }^{121} \mathrm{Sb}=\mathrm{X} \%$ and ${ }^{123} \mathrm{Sb}=\mathrm{Y} \%$
$X \%+Y \%=100 \% \quad X+Y=1 \quad \rightarrow \quad Y=1-X$
Average atomic mass $=\left(\right.$ The natural abundance x Atomic Mass) ${ }^{121} \mathrm{Sb}+\left(\right.$ The natural abundance x Atomic Mass) ${ }^{123} \mathrm{Sb}$
$121.76=(X$ * 120.904 $)+(Y$ * 122.904 $)$
$121.76=(X * 120.904)+((1-x) * 122.904)$
$121.76=120.904 X+122.904$-122.904 $X$
$-1.144=-2 x$
$X=0.572 \quad Y=1-0.572=0.428$
$X \%=57.2 \%\left({ }^{121} \mathrm{Sb}\right) \quad \mathrm{Y} \%=42.8 \%\left({ }^{123} \mathrm{Sb}\right)$

Argon has three naturally occurring isotopes: argon-36, argon-38, and argon-40. Based on argon's reported atomic mass, which isotope do you think is the most abundant in nature? Explain

## Answer:

Argon-40

## Explanation:

The mass of Argon on the periodic table is 39.948.

The periodic table's atomic mass is the AVERAGE weight of ALL its isotopes.
If one isotope is MORE abundant than the others, the average will be closest to the mass of that isotope. So, the periodic table's 39.948 is closest to Argon-40

## Percent Composition of Compounds

Glucose, or blood sugar, has the molecular formula $\mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6}$.
a. What is the percent composition of glucose?

$$
\frac{n \times \text { molar mass of element }}{\text { molar mass of compound }} \times 100 \%
$$

Molar mass of $\mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6}=180.156 \mathrm{~g} / \mathrm{mol}$

$$
\begin{aligned}

\% \mathrm{O}= & \frac{6 \times 16}{180.156} \times 100 \%=53.29 \% \\
& 40 \%+6.714 \%+53.29 \%=100.0 \%
\end{aligned}
$$

b. How many grams of carbon are in 39.0 g of glucose (the amount of sugar in a typical soft drink)? Answer: 15.6 g C

## Percent Composition of Compounds

Which is richer source of nitrogen Urea $\left(\mathrm{NH}_{2}\right)_{2} \mathbf{C O}$ or Ammonia $\mathrm{NH}_{3}$ on a mass percentage basis?

$$
\frac{n \times \text { molar mass of element }}{\text { molar mass of compound }} \times 100 \%
$$

$$
\begin{aligned}
& \left(\mathrm{NH}_{2}\right)_{2} \mathrm{CO}=\frac{2 \times 14.01}{(2 \times 14.01)+(4 \times 1.008)+12.01+16} \times 100=\frac{28.02}{60.062} \times 100=46.6 \% \\
& \mathrm{NH}_{3}=\frac{14.01}{(14.01)+(3 \times 1.008)} \times 100=\frac{14.01}{17.034} \times 100=82.2 \%
\end{aligned}
$$

$\therefore \mathrm{NH}_{3}$ is richer
